

# TEXTURAL AND CHEMICAL CHARACTERIZATION OF SULPHIDES FOR IMPROVED BENEFICIATION AND EXPLORATION, SKELLEFTE DISTRICT, SWEDEN

**Jonathan Rincón**

P.h.D. Student in Ore Geology

Division of Geosciences and Environmental Engineering  
Department of Civil, Environmental and Natural Resources Engineering

Luleå University of Technology

[jonathan.rincon@ltu.se](mailto:jonathan.rincon@ltu.se)

11 of November 2020

# Motivation

- Limited data on the distribution of trace elements in sulphides in Swedish VHMS deposits.
  - Precious elements (e.g. Ag, Au)
  - Deleterious elements (e.g. Sb, Cd, Hg, Mn)
  - Critical elements (e.g. In, Bi, Ga, Ge)
- Finding VHMS deposits using classical exploration methods can be challenging.
  - Graphite and pyrrhotite in the Vargfors group (Skellefte district) complicates geophysical detection of blind VMS deposits.
- The use of a mineralogical approach for the control of element deportment in beneficiation products.

# Project Overview

- A 4 year PhD project at LTU (2019-2023).
- Funded by Boliden Mineral and SGU.
- Main topic: Distribution of trace elements (critical, precious and deleterious) in and around a Palaeoproterozoic VMS deposit.
- Main objectives:
  - **Geological:** Improved understanding of the trace element distribution in Swedish VMS deposits.
  - **Exploration:** New tools for finding blind massive sulphide deposits by understanding associated sulphide haloes.
  - **Beneficiation:** Improved recoveries, including better understanding of trace element deportment.

# Research group

Luleå University of Technology	Role
Jonathan Rincon	P.hD. student
Assoc. Prof. Nils Jansson	Project leader, main supervisor
Prof. Christina Wanhainen	Associate supervisor
Dr Helen Thomas	Associate supervisor
Boliden Mineral AB	Role
Dr Christiane Kaiser	Coordinator and advisor, Exploration
Iris McElroy	Coordinator and advisor, Process Technology
Mac Fjellerad Persson	Coordinator and advisor, Exploration
Rickard Långström	Coordinator and advisor, Process Technology

# Work packages

- Drill core logging, petrography, textural analysis of ore types and sulphides.

WP1  
(2019)

Mineral  
characteriz-  
ation

- Detailed mineral chemical characterization of ore and sulphides (SEM, EPMA, LA-ICP-MS).

WP2  
(2020)

Trace  
element  
analysis

- Sulphur source and conditions of remobilization using in-situ SIMS analysis.

WP4  
(2022)

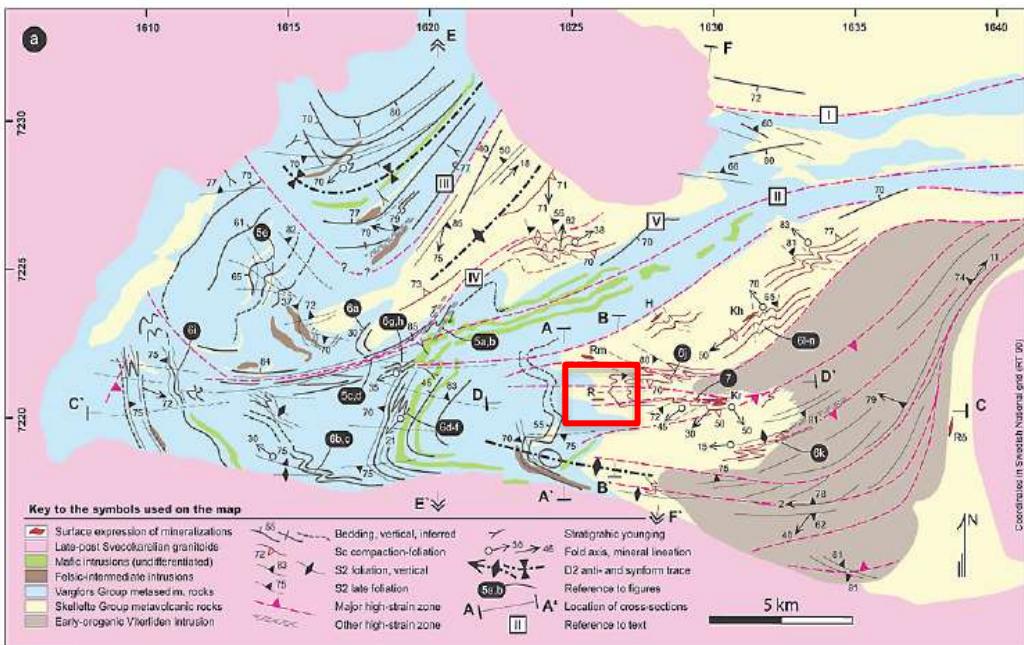

Sulphur  
isotope  
analysis

- Detailed mineral quantification and mineral chemistry . Flotation tests. Geometallurgy. (SEM, EPMA, LA-ICP-MS).

WP3  
(2021)

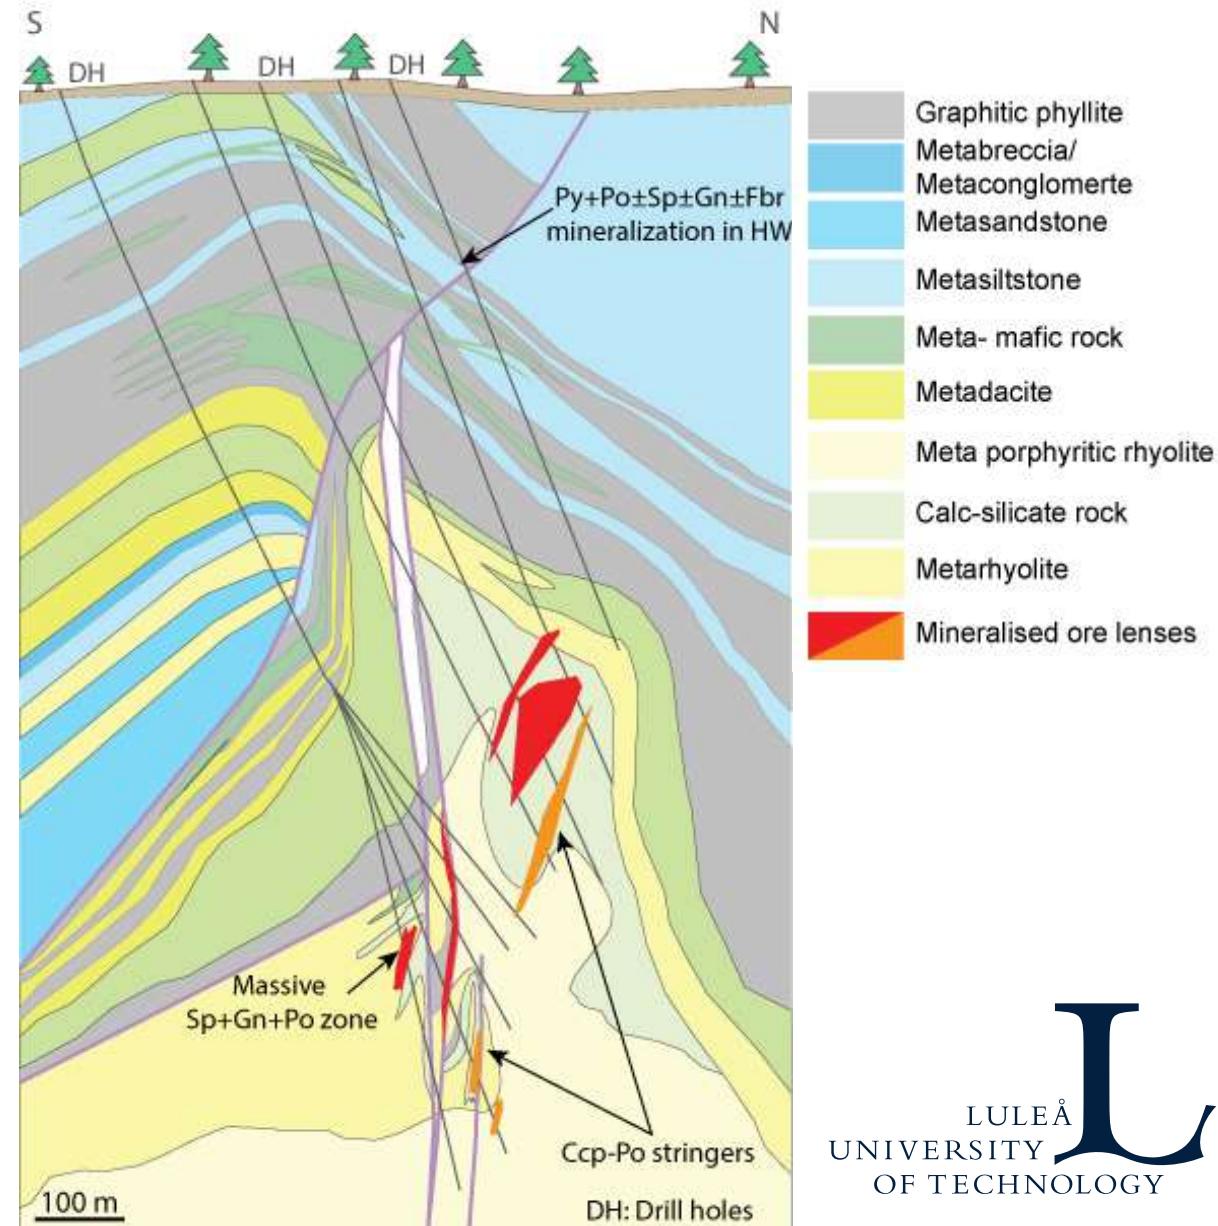

M.Process.  
tests

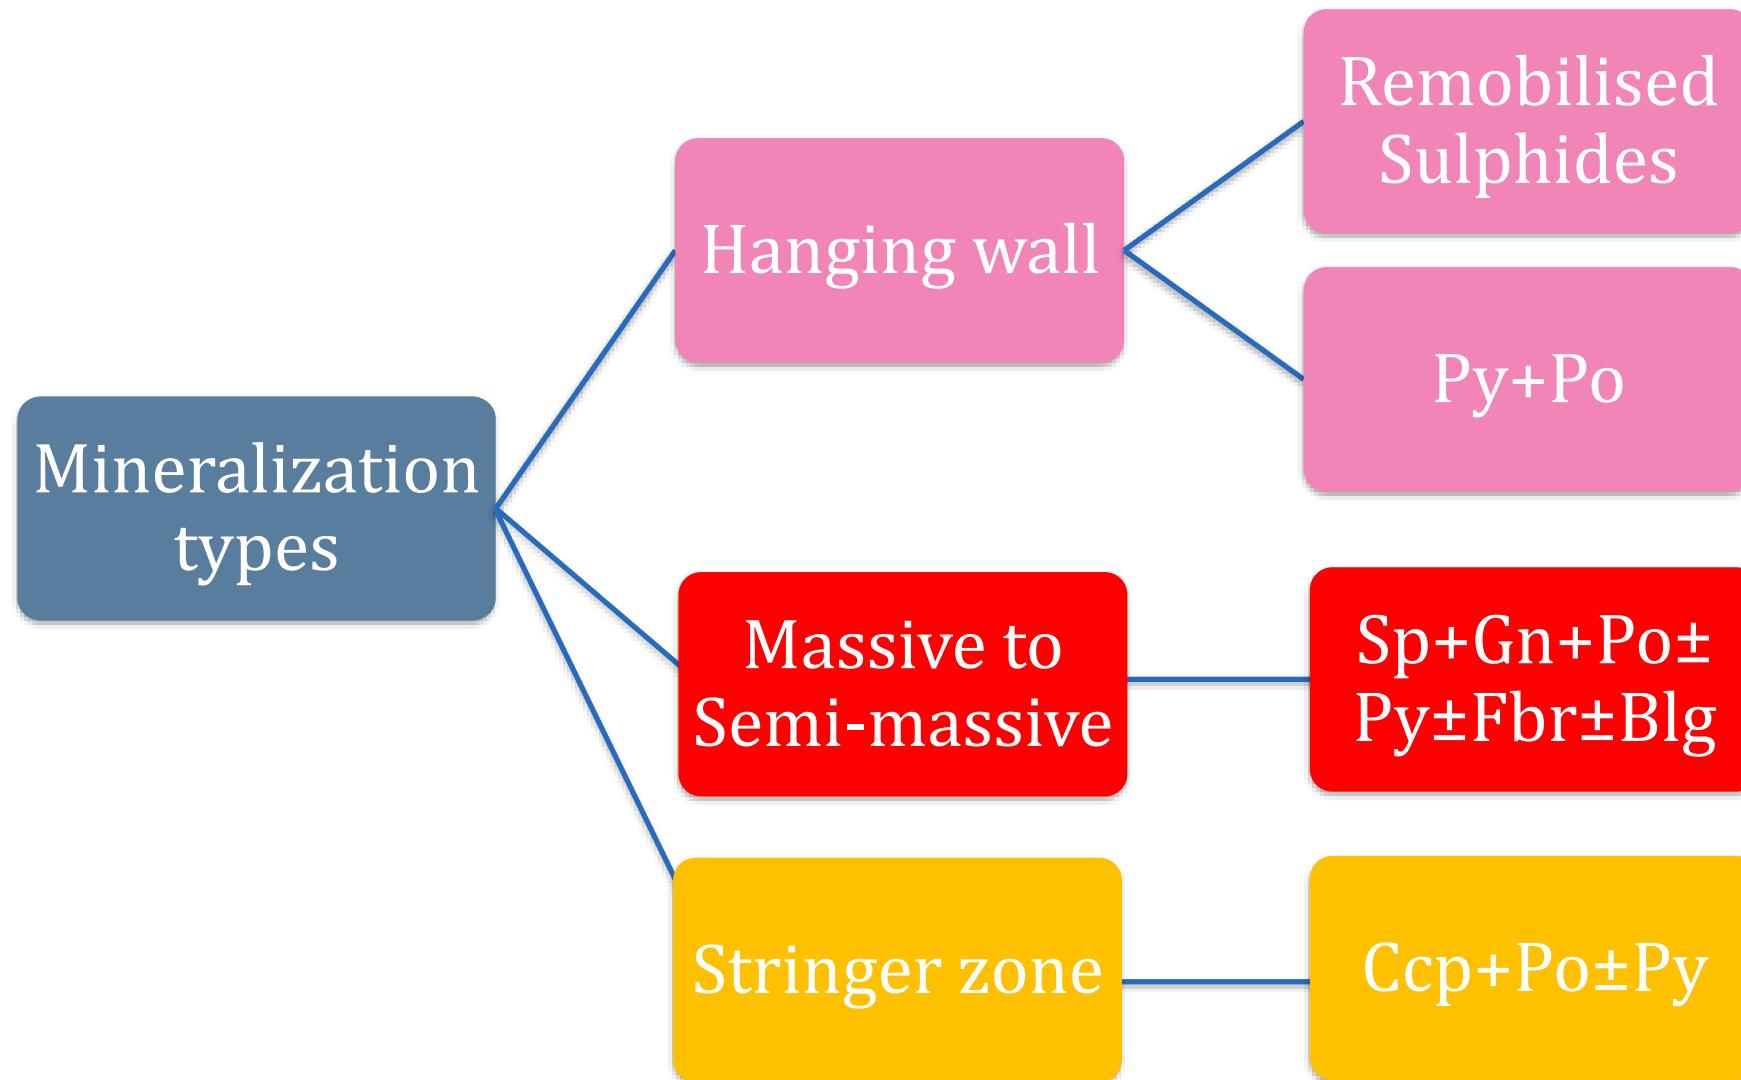

# Rävliden North

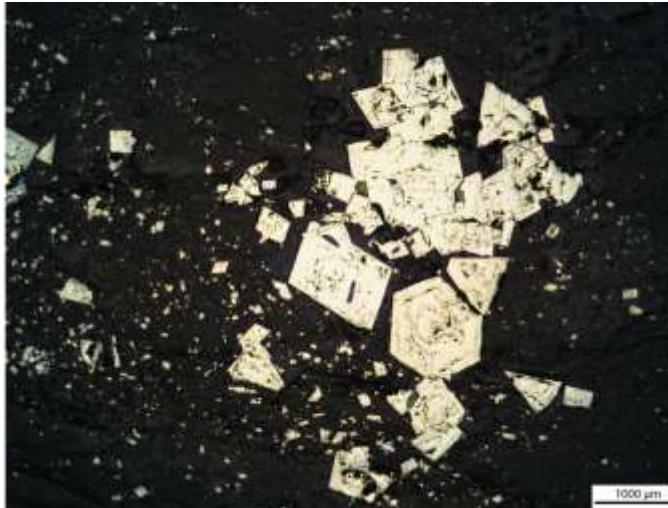

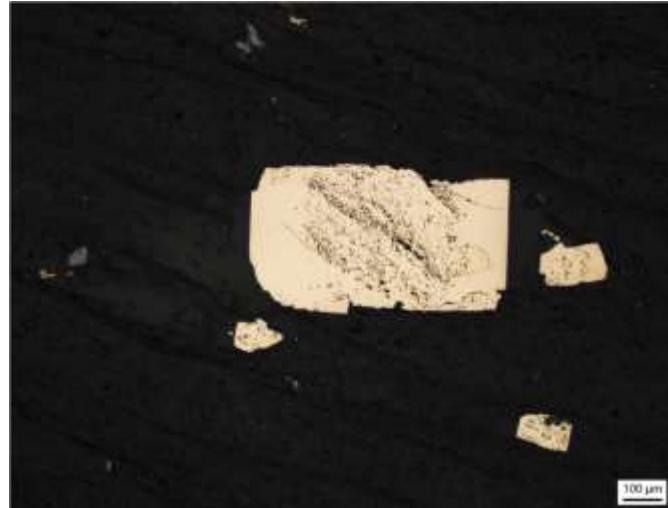

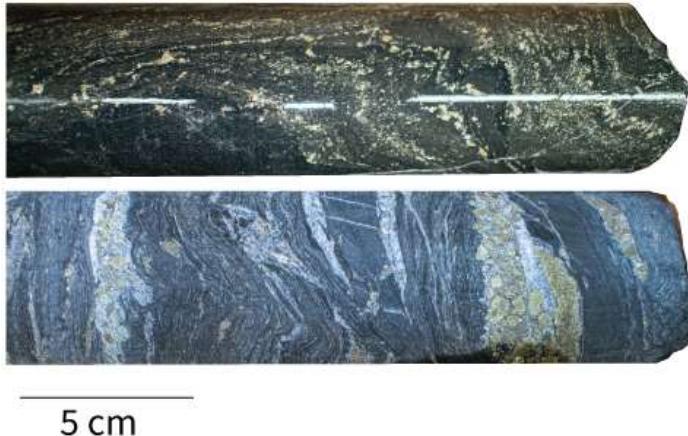

Regional geological map after Skyttä et al. (2012)

- 'Rävliden horizon': Syngenetic VMS deposit at the Skellefte group-Vargfors group contact.
- Greenschist to lower amphibolite facies.
- Hosted in a west plunging antiform.

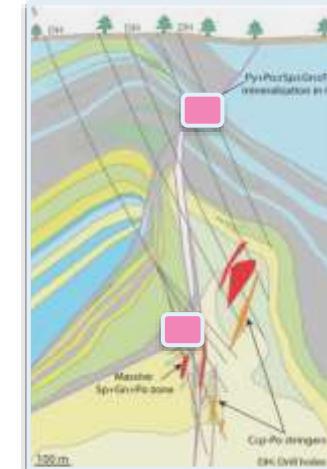

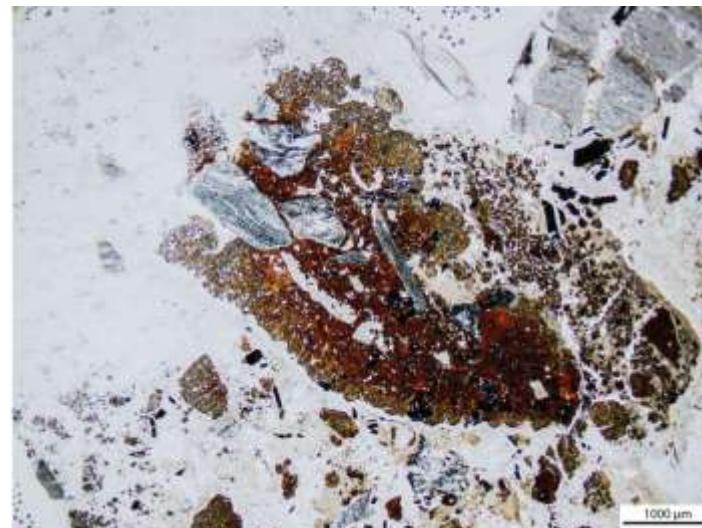

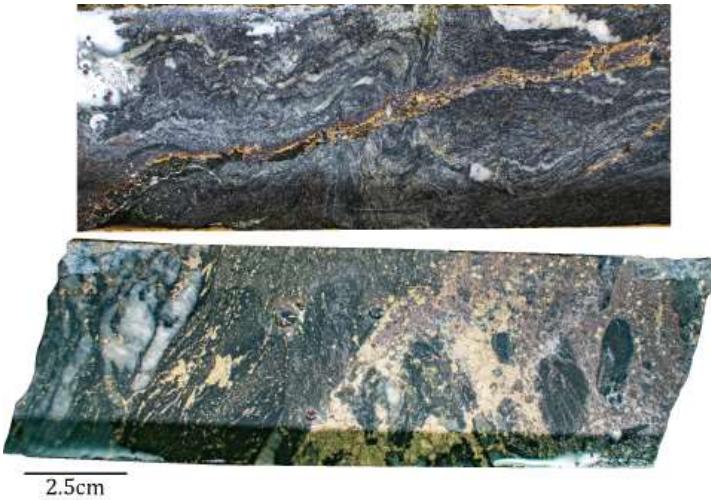

# Mineralogy and textures

Py+Po

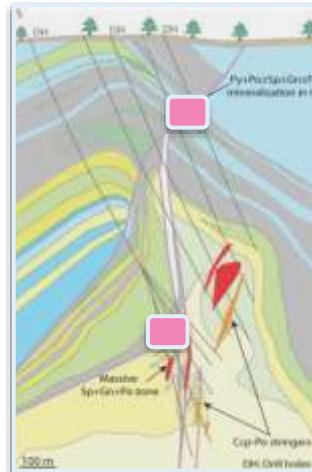

- Zoned pyrite mineralization in graphitic phyllites.
- Inter-tectonic to syn-tectonic pyrite porphyroblasts in shear zones.

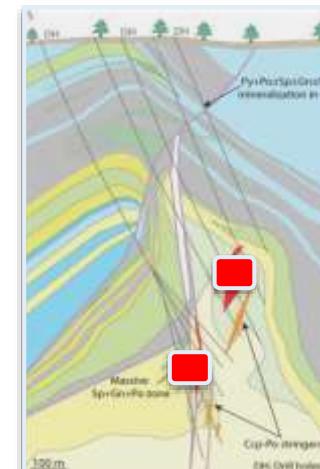

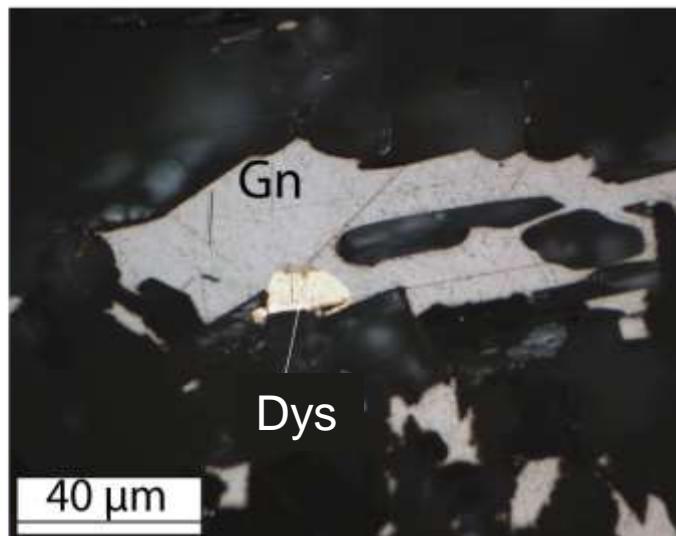

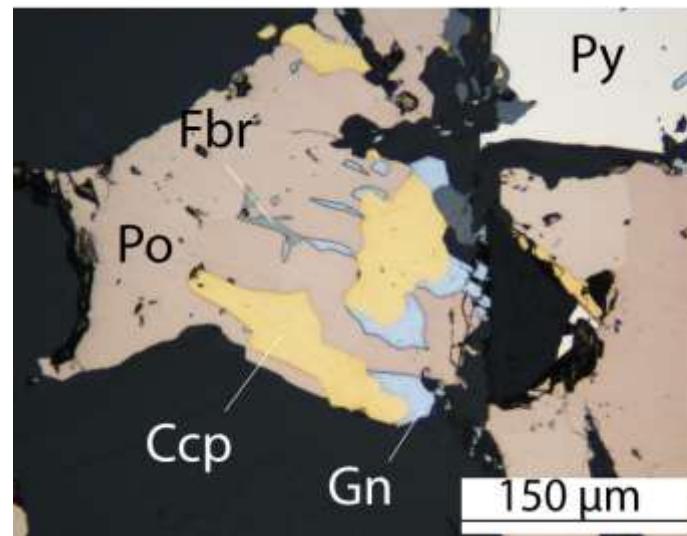

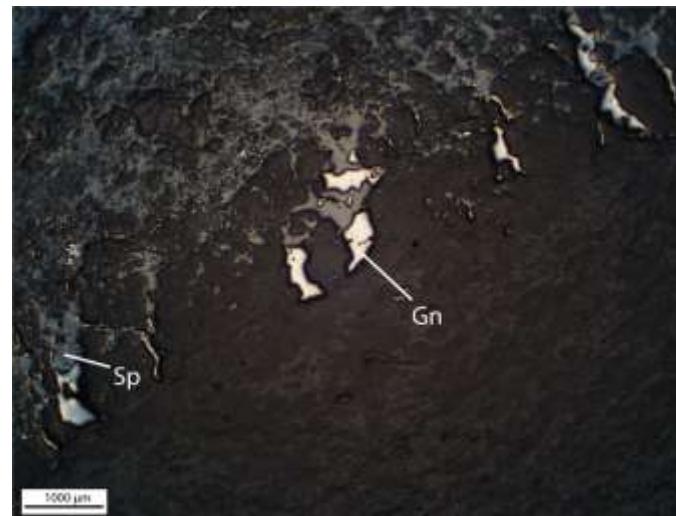

### Remobilised Sulphides

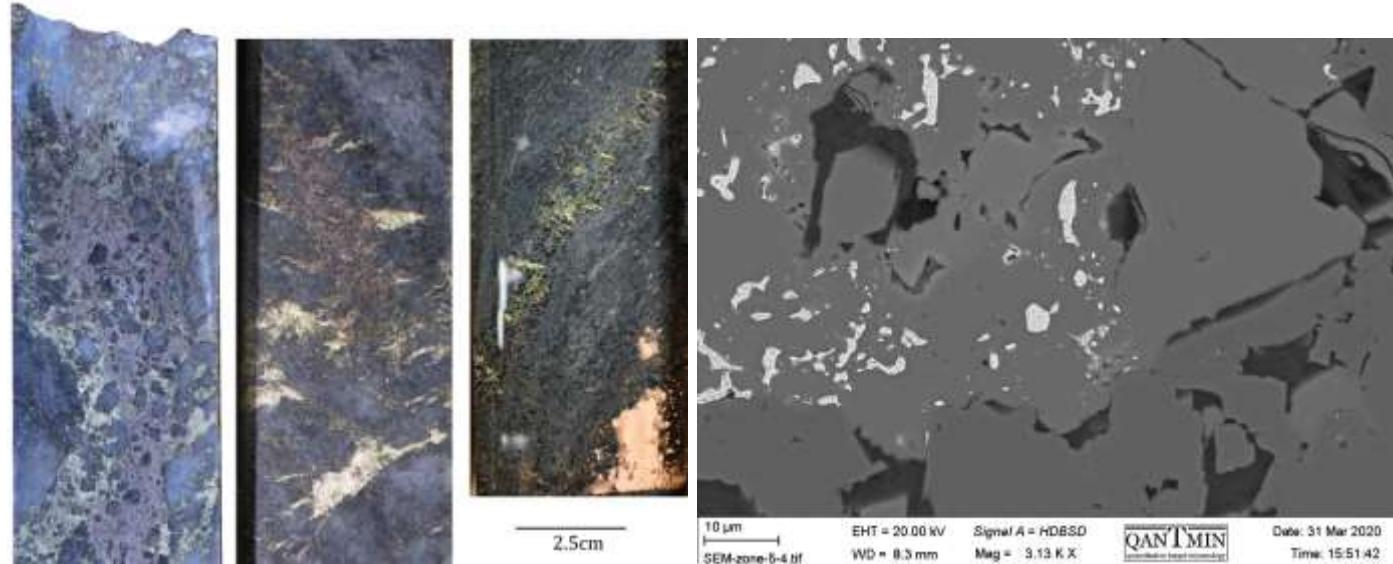

- Sphalerite+galena+pyrrhotite – cemented breccias.
- Sulphide-rich veins.
- Hessite ( $\text{Ag}_2\text{Te}$ ) as inclusions or intergrowths in galena.

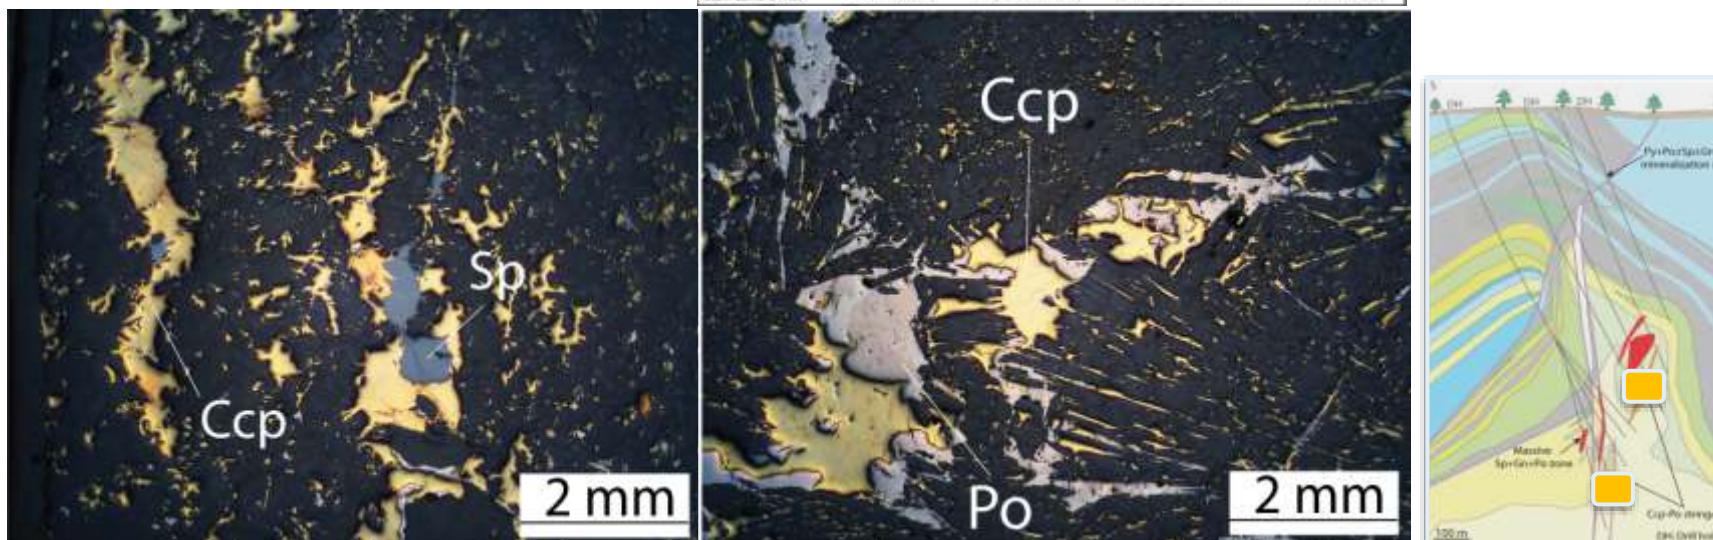

Massive Sp+Gn+Po±  
Py±Fbr±Blg

- Durchbewegt and foliated textures.
- Galena filling piercement veins and tension gashes.
- Silver-Sb sulphosalts (e.g. dyscrasite, freibergite) in galena.
- Euhedral pyrite porphyroblasts, some of them zoned.

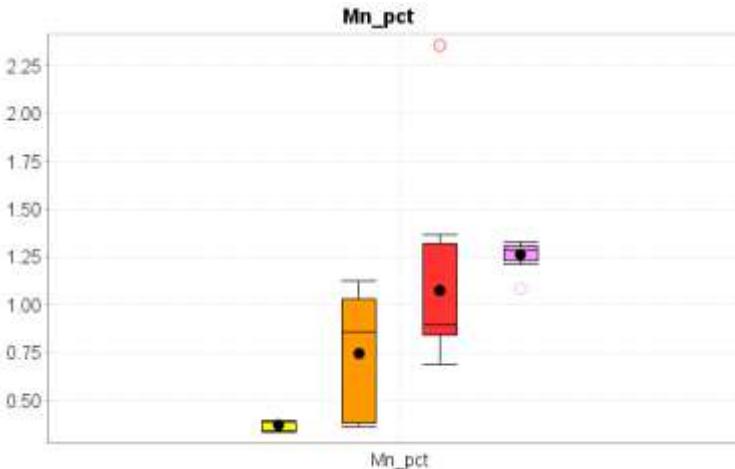

Ccp+Po±Py 'stringers'

- Ccp+Po±Sp in piercement veins.
- Breccia and durchbewegt textures.
- Ag-Hg amalgams in pyrrhotite, chalcopyrite, and sphalerite.

# EMPA results

## Sphalerite

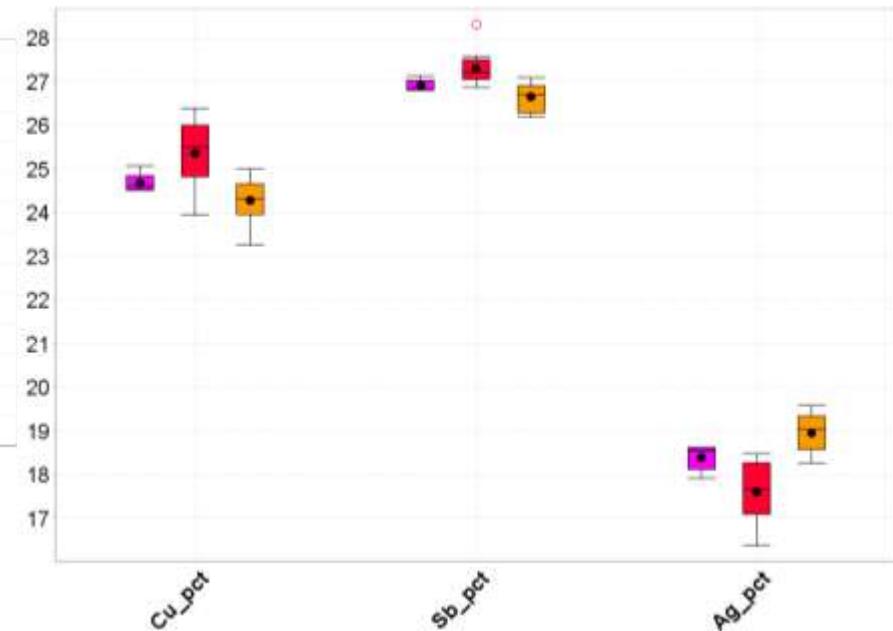

- Manganese content in sphalerite is highest in the hanging wall and massive Sp+Gn+Po mineralisation.

Massive Sp+Gn+Po  
 Ccp+Po mineralisation

- Cadmium content in sphalerite is highest in the hanging wall and Ccp+Po mineralisation.

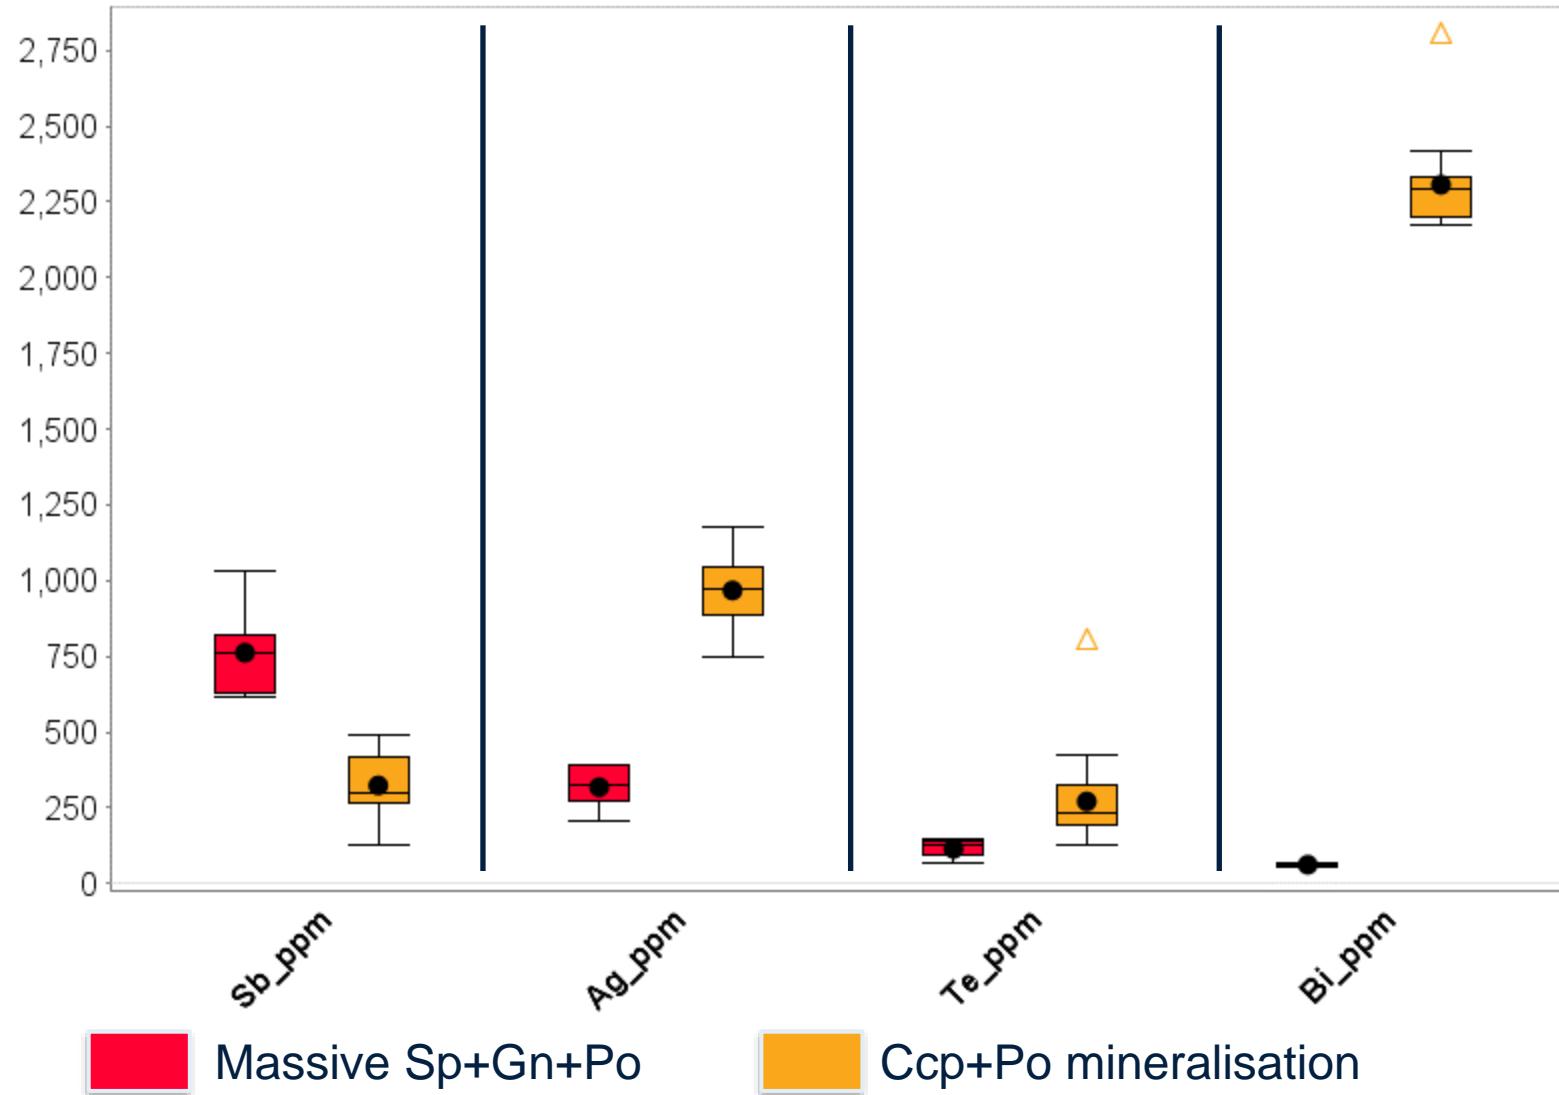

Distal HW mineralisation  
 Proximal HW mineralisation

## Freibergite

- Copper and antimony content in freibergite are highest in the massive Sp+Gn+Po mineralisation.
- Silver content in freibergite is highest in the Ccp+Po mineralisation.

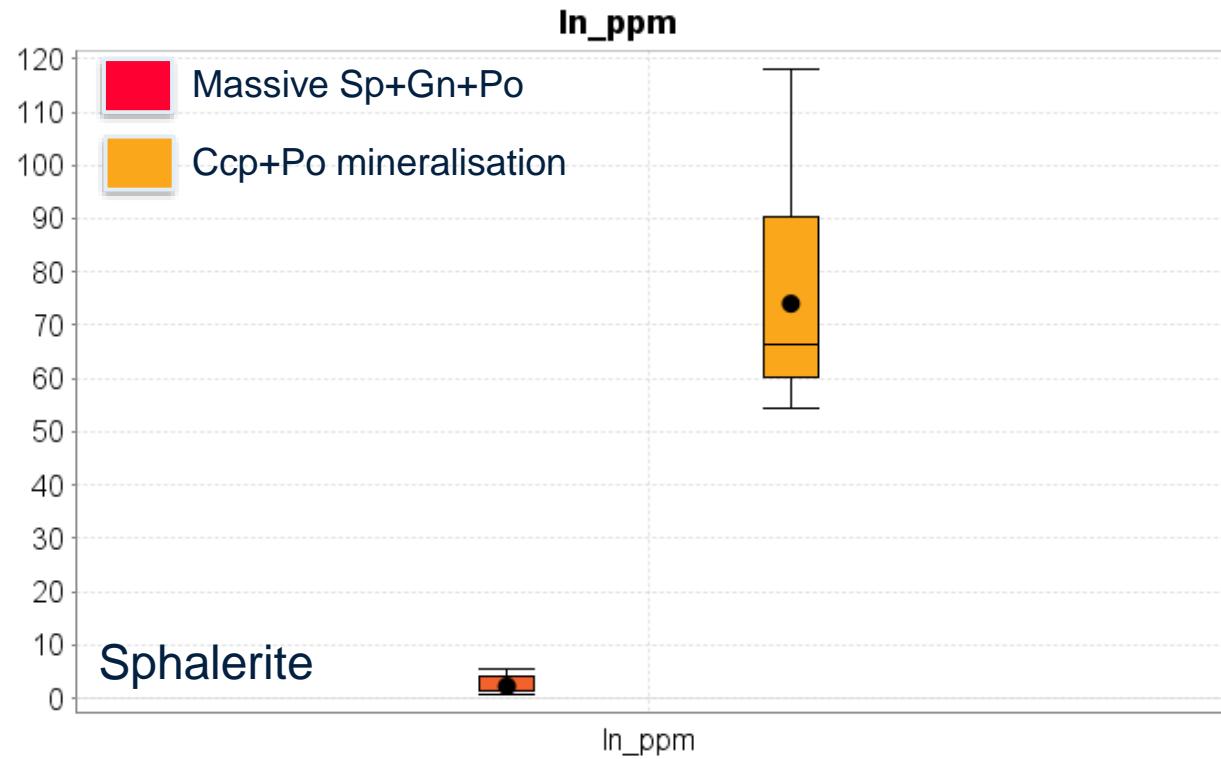

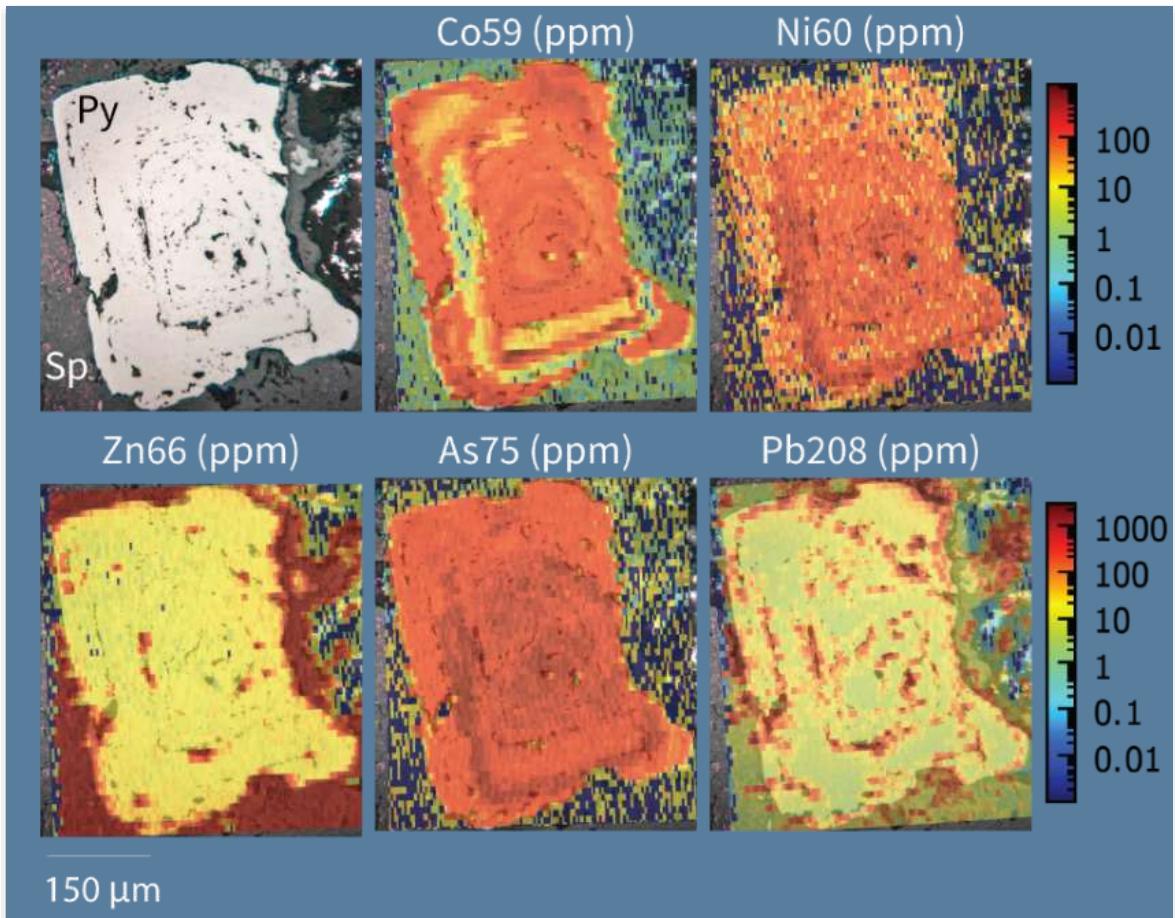

# LA-ICP-MS results

## Trace-elements in galena:

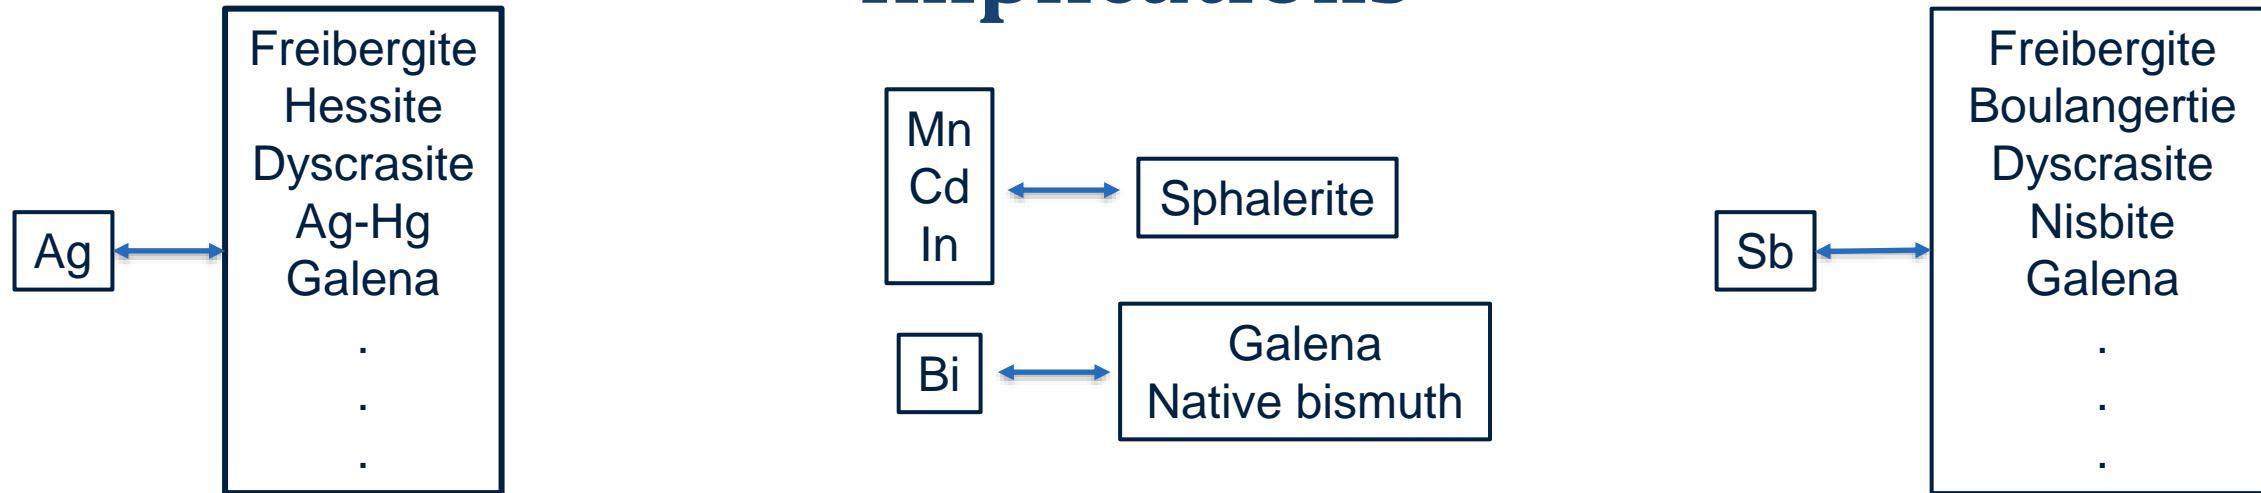

- Antimony content is highest in the massive Sp+Gn+Po mineralisation.
- Ag, Te, and Bi are highest in the Ccp+Po mineralisation.
- Median bismuth content is 2289 ppm in the Ccp+Po mineralisation.
  - Micro- to Nano-inclusions of bismuth minerals in galena.

# LA-ICP-MS results

- Indium median content in sphalerite:
  - 1.2 ppm in massive Sp+Gn+Po mineralisation.
  - 66.3 ppm in Ccp+Po mineralisation.
- Pyrite concentric trace element zonation.
  - Sulphide cemented breccia in the hanging wall.

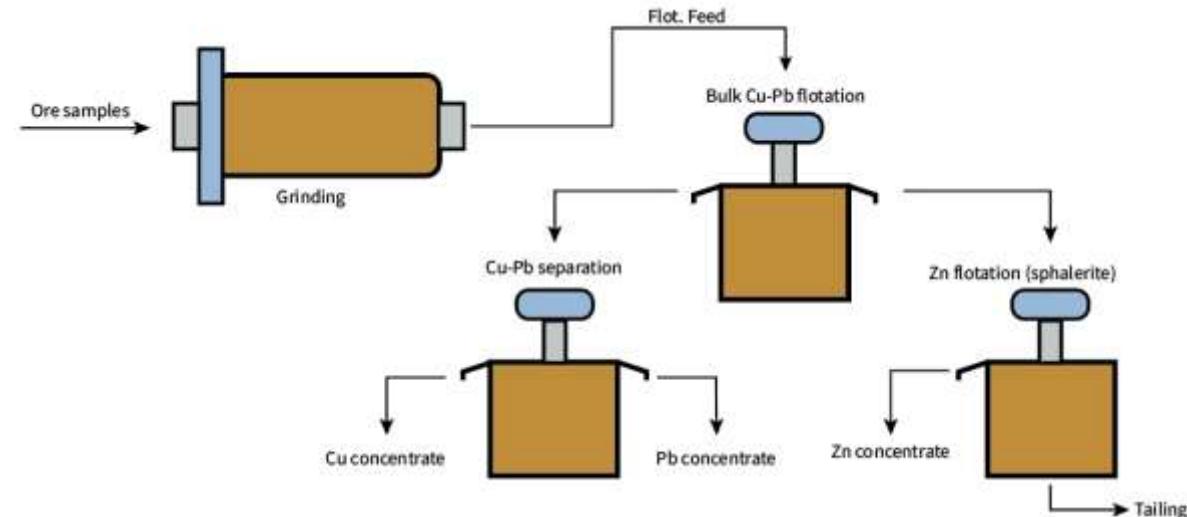

# Implications

- Potential use for exploration near Rävliden North or in similar VHMS deposits in the district.
- Knowledge of elements and minerals recovered in different flotation products.
- Variability at deposit scale.

# Future work

- Flotation and comminution tests.
  - Sphalerite Fe content can be detrimental for flotation (reduced efficiency in collector adsorption) (Boulton et al. 2005).
  - Talc and tremolite are problematic gangue minerals (Farrokhpay et al. 2018, Mishra et al. 2013).

- More LA-ICP-MS analyses in samples from each mineralisation style, and in flotation products.
